The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                            This invention relates to a novel method for identifying essential genes for survival or virulence of mycobacteria species. The method comprises aligning the genomic sequence of a first mycobacterium species on a genomic sequence of a second mycobacterium species on a polynucleotide sequence that is highly conserved in both genomes with no counterparts in other bacterial genomic sequences and that corresponds to an essential gene for the survival or virulence of mycobacterium species. The method of the invention is useful for detecting M. tuberculosis or M. leprae infection. The method reduces the number of potential new targets and protective antigens for new drugs and vaccine compositions to treat and prevent mycobacterial diseases, particularly tuberculosis and leprosy. The present sequence represents a Mycobacterial cosmid DNA sequence used in the method of the invention
                                           Identifying and selecting genes for survival or virulence of mycobacteria by a comparative genomic analysis of the sequences of Mycobacterium tuberculosis and M. leprae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a new compound targeted to a nucleic acid encoding MAD1-like 1 which specifically hybridises with the nucleic acid encoding MAD1-like 1 and inhibits expression of MAD1-like 1. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer. The present sequence represents human MAD1-like 1 DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotide compound that inhibits expression of MAD1-like 1, useful for preparing a composition for treating hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Rat; ds; gene; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of determining susceptibility of an individual to joint space narrowing and/or osteophyte development and/or joint space narrowing and/or osteophyte development and/or joint pain comprising identifying whether the individual has at least one polymorphism in a polymucleotide encoding at least one of the protein listed in the specification. The methods, composition and agent are useful for modulating the susceptibility of an individual to joint space narrowing and/or osteophyte development and/or joint pain that is associated with a disease, preferably osteoarthritis. The cell line and the non-human animal are useful for screening for an agent for diagnosing to an individual having susceptibility to joint space narrowing and/or osteophyte development and/or joint pain. This sequence corresponds to the polymucleotide encoding a protein listed in the specification. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at Ep.wipo.int/pub/published_pct_sequences).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

found in Pseudomonas syringae pathovar tomato strain [strain T1(A)], which mediates bacterial speck disease in tomato plants. The present invention describes identifying genes that are up- or down-regulated in the defence response and that are involved in the interaction of Avr-Pto with Pto and/ or Prf. As such, these novel recombinant polymucleotides can be used to generate transgenic plants that are resistant to bacterial speck disease and furthermore exhibit increased resistance against biotic and abiotic stresses. This polymucleotide sequence is a recombinant tomato polymucleotide used to generate genetically engineered, disease resistant plants of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               engineered plants. Specifically, it refers to compositions useful for transforming plants with a recombinant polynucleotide or plant gene that shows a specific pattern of expression associated with the Avr-Pto mediated defence response. Avr-Pto is described as the avirulent Pto gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New genetically engineered plant comprising a recombinant polynucleotide showing expression associated with Avr-Pto mediated defense response, useful in increasing resistance of plant against bacterial speck disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a method of generating novel genetically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        77.0%; Score 15.4; DB 12; Length 448; 94.1%; Pred. ```
The present sequence encodes a polypeptide which is a transporter of a linear polyol. DNA encoding linear polyols is used to produce a selection system for transformed cells, based on the use of polyols as the only carbon source. It is also used to produce transgenic plants with increased resistance to pathogens and salt stress. The use of a linear polyol for selection eliminates the need for toxic selection reagents solved as antibiotics. Also, the linear polyol is not essential for the plant, once selection has been made. The linear polyol has a main chain of 5-8, preferably 6, carbon atoms and is selected from sorbitol, dulcitol, galactitol, (myo-)inositol, ribitol, or xylitol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAX20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reponema pallidum infection; syphilis; Borrelia infection; animal;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                        The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid are prepresentative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing production of transgenic plants, cells and seeds and in producing plants of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                         Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polyol transporter protein from plants, for selecting transformed cells and for imparting pathogen and salt-stress resistance to plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA01094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a comprising of nucleic acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a blochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism or random. Many of these do not carry transduced host encogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The present sequence of the printion. Note: The complete sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                           Mouse; murine; carcinoma associated; oncogene; carcinoma; cancer; breast; prostate; lymphoma; leukaemia; cytostatic; gene therapy; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant nucleic acid encoding carcinoma associated protein, useful for preparing compositions for treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 21981 BP; 5568 A; 4945 C; 5268 G; 5590 T; 0 U; 610 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 15.4; DB 9; Length 21981;

A polymucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polymptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a mouse gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer diagnosis, cancer treatment, carcinoma, cytostatic, gene therapy, lymphoma, breast cancer, prostate cancer, leukaemia, ds; mouse, murine, Sox4.
                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; SEQ ID NO 97; 2304pp; English.

                                                                                                                                                                                                                                                                              This invention relates to novel recombinant nucleic acids for use in diagnosis and treatment of cancer, especially carcinomas, as well as the use of compositions in screening methods. The compositions of the invention may have cytostatic activity whilst the disclosed sequences may be useful for gene therapy. The carcinoma associated nucleic acids and proteins are useful for diagnosing and treating carcinomas, for example lymphoma, breast cancer, prostate cancer or leukaemia, or for screening drug candidates or bloactive agents capable of binding to, or modulating the activity of, a carcinoma associated protein. The present sequence is the genomic DNA sequence of the mouse Sox4 gene which is a carcinoma associated gene of the invention.
                                                                                                                                                                                      New carcinoma associated nucleic acids and proteins, useful for screening drug candidates, or for diagnosing and treating carcinomas, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Contiguous nucleotides to an isolated nucleic acid comprising at least in the specification, or its complement. The nucleic acids encode cancerassociated proteins. Also included are an expression vector comprising the above canociated proteins. Also included are an expression vector comprising the above comprising the isolated nucleic acid cited above, a host cell comprising the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising at least 10 contiguous nucleotides of any of the above comprising to the above polypeptide, a hybridoma that produces the above polypeptide, a hybridoma that produces the above monoclonal antibody, a pharmaceutical composition comprising the above comprising the above polypeptide, a hybridoma that produces the above antibody and a pharmaceutical composition comprising the above continued to antibody and a pharmaceutical excipient, a kit for detecting cancer cells (comprising the antibody cited above, methods for disposing cancer or for detecting the presence or absence of cancer cells in an individual, a method for inhibiting growth of cancer cells in an individual, an electronic library comprising the above polymetic or polypeptide (or their fragments), methods of screening the activity of a CA protein (CAP) methods for detecting cancer activity of a CA protein (CAP), methods for detecting cancer and a method for inhibiting the above cancer cells and a cancer cells and a cancer activity of a CA protein (CAP), methods for detecting cancer and a method for their fragments), methods for detecting cancer and a method for their fragments, especially lymphoma and clear and a method for their parent sequence and a method are useful for detecting cancer. The present sequence is a mouse CAP genomic sequence. Note: The sequence data for this patent did not form part of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human cytomegalovirus; HCMV; CMV; yeast artificial chromosome; YAC; vaccine; immunisation; infection; antiinflammatory; immunosuppressive; virucide; hepatotropic; congenital infection; jaundice; pneumonitis; respiratory distress; convulsive seizure; mental retardation; hepatitis; neurologic disability; asymptomatic adult infection; mononucleosis; retinitis; acquired immune deficiency syndrome; AIDS; genome; ds.
                                                                                                                                                                                                           The invention relates to an isolated nucleic acid comprising at least 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 227448 BP; 54780 A; 54263 C; 56236 G; 60311 T; 0 U; 1858 Other;
                                             New isolated cancer-associated polynucleotides and polypeptides useful for diagnosing, preventing or treating cancers, especially lymphoma and leukemia, or in screening for agents that modulate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human cytomegalovirus strain AD169 genomic sequence SEQ ID NO:64.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 15.4; DB 13; Length 227448; Pred. Composition of a human cytomegalovirus (HCMV) genome. Also described is a composition of a human cytomegalovirus (HCMV) genome. Also described is a composition of a human cytomegalovirus (HCMV) genome. Also described is a composition suitable for use as a vaccine comprising the isolated crecombinant DNA molecule and an excipient. The YAC has antiinflammatory, immunosuppressive, virucide, and hepatotropic activities, and can be used in vaccine production. The YAC vector and the recombinant DNA molecule are useful as vaccines for treating infections caused by CMV, e.g. congenital infections such as jaundice, respiratory distress and convolative seizures, which may result in mental retardation, neurologic disability or death; or asymptomatic adult infections such as monoucleosis, hepatitis, pneumonitis and retinitis. The vaccine can also celection therapy after organ transplantation. The vector is also useful as a a tool for studying the replication of CMV using cell-line models and the function of sesential cis acting genes or nucleic acid sequences. The CMC vector provides an ease and rapidity in introducing single or continities multiple mutations exceeds the capacity of the vectors continities and interest multiple mutations exceeds the capacity of the vectors of the numan cytomegalovirus strain AD169 genomic sequence represents continue to the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                          Cytomegalovirus-yeast artificial chromosome (CMV-YAC) DNA molecule useful as a vaccine for treating CMV infections e.g. jaundice, respiratory distress, convulsive seizures, mononucleosis, hepatitis, pneumonitis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      present invention describes an isolated recombinant DNA molecule

New array of nucleic acid probes, useful for in situ hybridization, in Southern, Northern or dot-blot hybridization to identify or detect the sequence or specific mutations of any gene.

Claim 1; SEQ ID NO 35400; 9pp; English.

The invention distincts a militarized application of a cid probes including one of 2,018,500 fully defined sequences, or its perfect match, perfect mismatch, antisense match or antisense mismatch. Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation of anylysis used in analysis of genetic variation or in hybridisation of tag-labelled compounds. The nucleic acid probes are specifically designed for analysis comprises to tall least one target sequence. The method of analysis comprises by pridising at least one or more nucleic acids to at least two or more nucleic acid probes and detecting the hybridisation. The nucleic acid probes and detecting the hybridisation. The nucleic acid probes are attached to a solid support. The analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, or family members of a gene and a cross-species comparison. Each of the nucleic acids further comprises a tag sequence. The array of nucleic acid probes is useful in in situ hybridisation, in Southern Northern or dothot hybridisation to identify or detect the sequence or specific mutations of any gene, in mapping the 5' termin of manaly har hybridisation for in screening companie labraries or subclones for primer extensions or in screening companie labraries or subclones for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly The invention discloses a microarray comprising a plurality of nucleic from USPTO at segdata.uspto.goc/sequence.html

RESULT 50

Human spliced transcript detection oligonucleotide SEQ ID NO:12622.

Human, mouse, rat, splice transcript, detection, RNA transcript, splice variant, transcriptome; oligonucleotide library; ss.

Homo sapiens.

```
The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcribtome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting manAs from a coligonucleotide libraries are useful for detecting manAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts of sub-transcriptome, and in libraries to detect transcripts of a sub-transcriptome under a particular libraries to detect transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue and pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect condition; to detect condition and particular developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular condition and mice, which are used in the exemplification of the printed specification, but was obtained in electronic format disorter.
                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and developmental-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           part of the printed specification, where we recommended pot_sequences directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description

COMMENT

Submitted (25-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA On Nv 1, 2001 this sequence version replaced gi:16152225. INFORMATION: http://www.hgsc.bcm.tmc.edu/ or email gc-help@bcm.tmc.edu CLONE LENGTH: This sequence does not necessarily represent the

entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Peatures listing.

ANNOTATION OF FEATURES:

STSS are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (GNLO. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice aites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

repeat_region

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.html. at URL

Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://www.cbs.dtu.dk/netpgene/chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the complete sequence against a peptide datebase and the Arabidopsis EST database a TIGR (http://www.tigr.org/tcb/art.html).

Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, tRNAscan-SE). Simple repeats are

```
**Consists of 11 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter.

This sequence will be replaced

**Put the finished sequence as soon as it is available and the accession number will be preserved.

Specifically, the indicated order and orientation of each sequence contig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8x average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319
Consensus quality: 142769 bases at least Q40 Consensus quality: 143769 bases at least Q30
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (29-MAY-2003) NIH Intramural Sequencing Center, 8717 Grovemont Circle, Gaithersburg, MD 20877, USA On May 29, 2003 this sequence version replaced gi:28867004.

Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. This clone overlaps with OSJNBA0060G17 (accession # AC135420) and OJ1384 AO2 (accession # AC118286).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KKLLPKVĞKECNEALAIGAQTMLQVPQSFELVFLLHMMNEIFGYTSDFCNALQRREQD

On Feb 25, 2004 this sequence version replaced 91:24414194.

This BAC clone was sequenced to phase II by the Academia Sinica and was completed to phase III by the Cold Spring Harbor Laboratory

Genome Center. This sequence was finished as follows unless otherwise noted all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. Genes were predicated from the integrated results of the following: BLASTN2.0, Geneshy (Chris Burge, http://www.igr.org/softlab/glimmerR (http://www.igr.org/softlab/glimmer/glimmer.html), TWINSCAN (http://www.tigr.org/softlab/glimmer/glimmer.html), TWINSCAN (http://www.tigr.org/softlab/glimmer.html), TWINSC

Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits.

Direct Submission

AL Submitted (13-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 13, 2003 this sequence version replaced gi:23111082.

The sequence in this assembly is a combination of BAC based reads and whole genome shorgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold', Mithin each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads.

Submitted (19-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 9, 2003 this sequence version replaced gi:24638855.

The sequence in this assembly is a combination of BAC based reads and whole genome shockput sequencing reads assembled using Atlass (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-casffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the serimated size. The sequence contigs within a contigs of the clone and there may be sequence contigs within a contigs scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequence and whole genome shotgun sequence reads.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                * NOTE: This record contains 31 individual

* sequencing reads that have not been assembled into
contigs. Runs of N are used to separate the reads
and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
However, it should not be assumed that this clone
will be sequenced to completion. In the event that
the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gap of 100 bp

                                                                                                                                                                                                                                              NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft" sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anderson, S., Barna, N., Bastien, V., Boguslavkiy, L., Boukhgalter, B., Brown, A., Camzata, J., Campopiano, A., Chang, J., Chazaro, B., Choepel, Y., Colangelo, M., Colling, S., Collymore, A., Cook, A., Cooke, P., DeArellano, K., Dewar, K., Diaz, J.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    * NOTE: This record contains 74 individual
* sequencing reads that have not been assembled into
* contiggs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Web site: http://www-seq.wi.mit.edu

                                                                                                                                                                            * NOTE: This record contains 74 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will

be preserved.

On Jun 21, 2002 this sequence version replaced gi:21213153.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (1.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em:, EMBL; Sw:,
SWISSPROT; Tr:, TREMBL; Wp:, WORWDEP; Information on the WORWDEP
herro.//www.earnor.ac.uk/Projects/C elegang/wormone, RPD3-456018 is

NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html). NOTE: This is a 'working draft' sequence. It currently consists of 60 contigs. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contrigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by Pox testing. In addition, the sequence assembly is based on at least 8x average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319
Consensus quality: 147215 bases at least Q30
Consensus quality: 147222 bases at least Q20
                                                                                                                                                                                              Direct Submission
